When we sort on multiple fields, the sort order is important! The results of this query are first sorted in ascending order on the `rating` field. If multiple movies have the same rating, the second field (`release_date`) is used to break the tie, so results with the same rating are sorted by `release_date` in ascending order.

> **NOTE** We look at *geosorting* in chapter 12. Understanding geoqueries and sorting on geopoints warrant a dedicated chapter.

8.8.5 Manipulating results

You may have observed that search queries return results from the original documents specified with the `_source` field. Occasionally, we may want to fetch only a subset of fields. For example, we may need just the title and rating of a movie when a user searches for a certain type of rating, or we may not need the document included in the engine's response. Elasticsearch lets us manipulate the response, whether fetching selected fields or suppressing the entire document.

SUPPRESSING DOCUMENTS

To suppress the document returned in the search response, we set the `_source` flag to `false` in the query. The following listing returns a response with just the metadata.

Listing 8.28 Suppressing the source document

```
GET movies/_search
{
  "_source": false,
  "query": {
    "match": {
      "certificate": "R"
    }
  }
}
```

Setting the _source flag to false removes the source document from the result.

The response does not mention the original document:

```
"hits" : [
      {
        "_index" : "movies",
        "_type" : "_doc",
        "_id" : "1",
        "_score" : 0.58394784
      },
      {
        "_index" : "movies",
        "_type" : "_doc",
        "_id" : "2",
        "_score" : 0.58394784
      },
      ...
]
```
