can query for only TVs that have four-star ratings or above (the `must_not` query uses a `range` query that filters out TVs with user ratings below 4.0).

Listing 11.7 Enhancing the `must_not` query

```
GET products/_search
{
 "query": {
   "bool": {
     "must_not": [
       {
         "terms": {
           "brand.keyword": [
             "Philips",
             "Samsung"
           ]
         }
       },
       {
         "range": {
           "user_ratings": {
             "lte": 4.0
           }
         }
       }
     ],
     "must": [
       {
         "match": {
           "product": "TV"
         }
       },
       {
         "term": {
           "resolution": {
             "value": "4k"
           }
         }
       },
       {
         "range": {
           "price": {
             "gte": 500,
             "lte": 700
           }
         }
       }
     ]
   }
 }
}
```

The must_not clause with two individual queries

The terms query that matches the given values in the brand field

The range query that fetches TVs rated less than or equal to 4 stars

The must clause with a few leaf queries

Although the query in listing 11.7 is verbose, dissecting it helps understand its crux. This `bool` query is composed of two clauses: `must` and `must_not`. The `must` clause searches for all 4K resolution TVs with a price tag between $500 and $700. This list is
