Let's code an example to demonstrate the `date_range` type. Venkat Subramaniam is an award-winning author who delivers training sessions on various subjects, from programming to design to testing. Let's consider a list of his training courses and the dates for our example. We create a `trainings` index with two fields—the name of the course and the training dates—that have the `text` and `date_range` type, respectively.

Listing 4.18 Index with a `date_range` type

```
PUT trainings
{
  "mappings": {
    "properties": {
      "name":{
        "type": "text"
      },
      "training_dates":{
        "type": "date_range"
      }
    }
  }
}
```

Name of the training session

The training_dates field is declared as a date_range type.

Now that the index is ready, let's index a few documents with Venkat's training courses and dates:

```
PUT trainings/_doc/1
{
  "name":"Functional Programming in Java",
  "training_dates":{
    "gte":"2021-08-07",
    "lte":"2021-08-10"
  }
}

PUT trainings/_doc/2
{
  "name":"Programming Kotlin",
  "training_dates":{
    "gte":"2021-08-09",
    "lte":"2021-08-12"
  }
}

PUT trainings/_doc/3
{
  "name":"Reactive Programming",
  "training_dates":{
    "gte":"2021-08-17",
    "lte":"2021-08-20"
  }
}
```
