

The response is something like the following, where each bucket has a key and a value:

```
"aggregations" : {
  "critical_patients_as_histogram" : {
    "buckets" : [{
       "key" : 0.0,
       "doc_count" : 4
     },
     {
       "key" : 2500.0,
       "doc_count" : 3
     },
     {
       "key" : 5000.0,
       "doc_count" : 0
     },
     {
       "key" : 7500.0,
       "doc_count" : 3
      }]
  }
}
```

The first bucket has four documents (countries) with a number of critical patients up to 2,500. The second bucket has three countries with a number of critical patients between 2,500 and 5,000, and so on.

RANGE BUCKETS

The `range` bucketing aggregation defines a set of buckets based on predefined ranges. For example, say we want to segregate the number of COVID casualties by country (casualties up to 60,000, 60,000–70,000, 70,000–80,000, and 80,000–120,000). We can define those ranges as shown here.

Listing 2.30 Casualties in custom ranges using `range` bucketing
