

Figure C.1 Elasticsearch Java namespace clients

C.6 Creating an index

Let's create a `flights` index using this Java API client. All index-related operations form a namespace called `indices`, so classes and a client related to operations on indexes are in the `co.elastic.clients.elasticsearch.indices` package. As expected, the client supporting index operations is `ElasticsearchIndicesClient`. To obtain this client, we must ask the main Java API client (`ElasticsearchClient`) to provide an instance of the client:

```
ElasticsearchIndicesClient elasticsearchIndicesClient =
       this.elasticsearchClient.indices();
```
